(54) LIGHT EMITTING DIODE LAMP

(57)Abstract:

PROBLEM TO BE SOLVED: To obtain a light emitting diode lamp wherein a fluorescent material emits light effectively having a prescribed bright color.

SOLUTION: A light introducing and scattering layer 14 is constituted of a scattering member 22 and a transparent binder 23 which perform the introduction and diffusion of light wherein emission light from a light emitting diode chip 11 is received directly in a state of bonding. In the layer 14, light introduced by the scattering member 22 is diffused by changing the reflecting direction of the light complicatedly, and introduced in a fluorescent light emitting layer 17 composed of the transparent binder 16 containing a fluorescent material 15 that emits light with a prescribed color. The light introducing and scattering layer 14 reduces the possibility of direct incidence to the fluorescent material 15 of the fluorescent light emitting layer 17 in a state that a light density is high as direct light from the light emitting diode chip 11, so that incidence in the fluorescent material 15 is performed in a state that the incident light is dispersed, and light emission is performed

by the whole of the fluorescent light emitting layer 17, thereby enabling effective light emission.
